

The ML20000 SAR Radio Dropper System is designed so that a parachutist can deploy small payloads such as radio or medical supplies while under parachute. The hand held package can also be deployed from an aircraft.

### Specifications:

- It is modular which allows the integration of different size fin drogues to manage the impact velocity.
- Attached to the system are a strobe light, and an audible locating device, which makes the system easier to find in poor lighting conditions.
- It will float in salt or fresh water and can be rapidly located in deep snow and at night because of a chemical light which illuminates the fin drogue.
